II. PRODUCT VARIATIONS

[TOP](#)

This policy is only applicable to certain programs and products administered by Capital BlueCross please see additional information below, and subject to benefit variations as discussed in Section VI below.

FEP PPO - Refer to FEP Benefit Brochure for information on Vision Services:

Note* - The Federal Employee Program (FEP) Service Benefit Plan does not have a medical policy related to these services.

III. DESCRIPTION/BACKGROUND

[TOP](#)

Visual field testing is a procedure to detect loss of peripheral vision and provide a mapping of identified loss to aid in the diagnosis of the cause. There are several types of visual field testing including tangent screen testing, confrontation visual field exam, and automated perimetry. Visual field testing is usually performed to aid in the diagnosis or treatment of eye disorders and other diseases, or may be performed as part of a routine eye examination.

MEDICAL POLICY

POLICY TITLE	VISUAL FIELD TESTING

V. DEFINITIONS

[TOP](#)

AUTOMATED PERIMETRY is a visual field exam in which the patient sits in front of a concave dome and stares at a central target within the dome. A computer-driven program flashes small lights at different locations within the dome’s surface, and the patient presses a button when he/she sees the small lights in the peripheral vision. The responses are compared to aged-matched controls to determine the presence of defects within the visual field.

CONFRONTATION VISUAL FIELD EXAM is a quick and basic evaluation of the visual field done by an examiner sitting directly in front of the patient. With one eye covered, the patient is asked to look at the examiner’s eye and tell when he/she can see the examiner’s hand.

PERIPHERAL VISION is the capacity to see objects in the outer aspects of the field of use caused by reflected light waves that fall on areas of the retina distant from the macula.

TANGENT SCREEN EXAM is a visual field exam where the patient sits about three feet from a screen with a target in the center. The patient is asked to stare at the central target and let the examiner know when he/she can see an object brought into the peripheral vision.
